Data Types : what type of values can we store ?

1. Int -> -5, 5, 0, 100…..(negative + positive + 0)
-1e9 <= int <= 1e9
10^9 = 1000000000

2. long long -> Large integers
-1e18 <= long long <= 1e18

3. double
E.g. -> 3.5 , -122393.9595
10000000.0394 * 34955965.4545

4. long double

5. Char (character)
E.g. -> ‘A’, ‘9’, ‘z’

6. String -> stream of characters
E.g. -> “Khushi”, “19”, “kshama”, “10+20”

7. bool -> it has only 2 values : true and false
Bool Ok = true (1 / on)

How to take input & output ?

“Cout” displays information!
“Cin” takes input from the user!

Variables : is a name place to store a value in the memory!!

Operators :

1. Addition : +
2. Subtraction : -
3. Multiplication : *
4. Division : /
5. Remainder : % (modulo) -> gives remainder after division
6. Conditional operators : < , > , == , <= , >=

Keywords : words which has a pre-defined meaning like
E.g. -> if, else, cin , cout, while, true, false, do

Conditional Statements :
A < b
Syntax :

```
If (condition){
   // if condition is satisfied  or true ….then this block gets
executed

}else{
   // block
}
```

Loops :

Syntax :

```
for(initialization ; condition ; increment / decrement){
    // block of code
}
```

// till when this loop will execute : jab tk meri condition true
// tab tk ye loop run karega

Function : reusable block of code

Syntax :

```
Data_type(int) function_name (int parameter1, int parameter2,
…….){
      // block of code
Return (int)a;
}
```

Homework :

Problem 1 : Sum of two numbers
Read two integers and print their sum

Problem 2 : Even or odd
Read an integer and check whether it is odd or even

Problem 3 : Print 1 to n
Read ‘n’ and print numbers from 1 to n

Problem 4 : Maximum of two numbers
Read two integers and print max among them
